Lab Workbook — Manual Testing and Defect Report

Project: MindBridge Course Registration platform — new checkout flow

Your name:Gültəkin Əzizova

Date:07.10.2026

Jira project name:MindBridge_LC2_Project_Seed

Complete all three tasks below with both text and screenshots. When finished, export this document as a single PDF — that PDF is your submission for the graded assignment.

Task 1: Exploratory testing session summary

Summarize your 15-minute exploratory session. List the heuristics you applied and the bugs you discovered.

Session summary (what you tested and how):

Conducted a 15-minute exploratory testing session on the MindBridge application. Tested the core user flows including Catalogue navigation, search and filter functionality, cart operations (adding items, increasing/decreasing quantity, updating total price, removing items), checkout form validation, and user logout. Verified that basic alphabetical inputs were blocked on numeric fields, but uncovered input boundary and validation flaws in the checkout form (payment fields allowing excessive length and date fields accepting invalid days like 31+).

Heuristics applied (name at least two):

• **Input Boundary Testing (Boundary Value Analysis / Negative Testing):** Tested form fields with invalid characters, excessive lengths, and out-of-range dates.

• **Goldfish (Feature Tour / Scenario Testing):** Walked through the complete end-to-end user journey from browsing the catalogue to cart management, checkout, and logging out.

Bugs discovered (one line each, naming the feature area and the observed failure):

• **Checkout - Card Details/Zip Code:** Payment form fields accept numbers exceeding the standard maximum length without restriction, allowing successful payment with invalid long inputs.

• **Checkout - Expiry Date:** The expiry date field accepts invalid days/months (e.g., day values greater than 31, such as `03/45`), successfully processing the payment instead of displaying a validation error.

Task 2: Your Jira bug report

Copy the text from each field of the Jira ticket you filed for the most critical defect you found, then insert a screenshot of the complete ticket below the text.

Summary: Checkout Form Expiry Date Accepts Invalid Days (GreaterThan 31) and Processes Payment Successfully

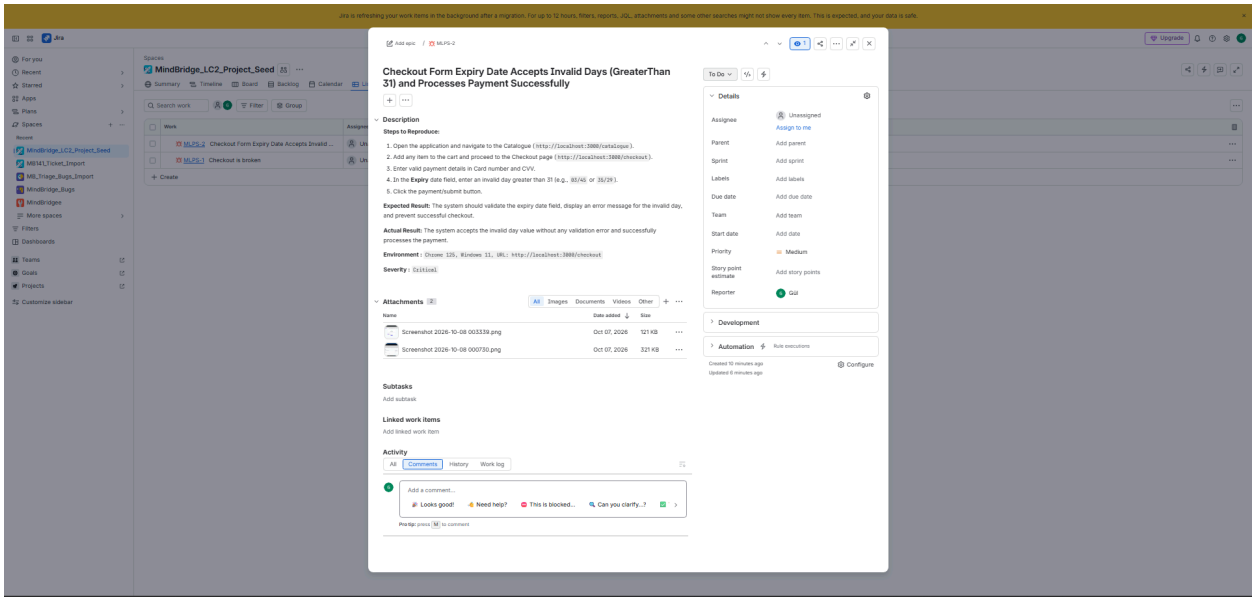

Steps to Reproduce
1.Open the application and navigate to the Catalogue (`http://localhost:3000/catalogue`).
2.Add any item to the cart and proceed to the Checkout page (`http://localhost:3000/checkout`).
3.Enter valid payment details in Card number and CVV.

4.In the Expiry date field, enter an invalid day greater than 31 (e.g., 03/45 or 35/29).
5.Click the payment/submit button.
Expected Result: The system should validate the expiry date field, display an error message for the invalid day, and prevent successful checkout.

Actual Result: The system accepts the invalid day value without any validation error and successfully processes the payment.

Severity: Critical

Task 3: Defect recovery — the rejected ticket

Describe each specific change you made to the rejected "Cannot Reproduce" ticket, and explain why that change makes the defect easier for a developer to reproduce. Then insert a screenshot of the updated ticket showing the new details and the **In Progress** status.

Change I made to the ticket : Added explicit environment details (browser name and version, OS, application URL), structured and numbered the reproduction steps sequentially starting from the initial state, clearly separated the "Expected Result" from the "Actual Result", and transitioned the ticket status to In Progress.

Why this helps a developer reproduce the defect: This allows the developer to replicate the exact testing environment without platform-specific variables, removes ambiguity by guiding them step-by-step through the user flow, and gives a clear target of what the system should do versus what it actually does, making the bug's logic immediately obvious.
