Session Based Test Management (SBTM) Charter

Application under test: MindBridge Course Registration platform — new checkout flow

Tester name / role:Gültəkin / QA tester

Date:08.10.2026

Application URL:http://localhost:3000

Session duration:
15 minutes (time-boxed)
Start time / End time:01:03/01:18

Charter (mission)

A charter is a one-sentence mission that keeps the session focused. Suggested charter below — edit it if your mission differs.

"*Spend 15 minutes exploring the new MindBridge checkout flow, with a focus on input validation and transaction state changes.*"

Focus areas

• Input validation — how does the checkout respond to unexpected, missing, or boundary-pushing input in the payment fields?

• Transaction state — does the application correctly handle the order submission state (button state, duplicate submissions, confirmation)?

Heuristics for this session

Heuristic

What to try
Rapid Input
Select controls (for example, the submit button) multiple times in quick succession.
Unexpected Characters
Enter special characters or symbols in fields that expect specific formats (for example, the payment fields).
Boundary / Goldilocks
Try too-short, too-long, empty, and at-the-limit values.
Interruption
Navigate away mid-flow (browser Back), then return and continue.

Session notes

Record what you tried and what you observed, as you go. One row per observation.

Heuristic applied	*1.Boundary / Goldilocks* *2. Boundary / Goldilocks* *3. Interruption*
Action performed	*1.Entered invalid day value greater than 31 (e.g., 03/45) in the Expiry date field and submitted payment.* *2. Entered excessive number of digits in payment card number and zip code fields.* *3. Entered custom payment details, navigated away mid-flow using browser Back button, and returned to the checkout page.*

Expected behavior	*1.System should validate the expiry date, show an error, and block checkout.* *2. System should enforce character limits and block oversized input.* *3. The form should either retain the user's entered state securely or handle session state consistently.*
Actual behavior	*1.System accepts the invalid day value and processes payment successfully.* *2. System accepts inputs exceeding standard maximum lengths without restriction.* *3. Form fields reset and revert to default pre-filled numbers upon returning to the page.*

Defects found

List only the observations you consider defects. Give each a severity: Critical, Major, or Minor.

Defect summary	*1.Checkout Expiry Date accepts invalid days (>31) and successfully processes payment.* *2. Payment card/zip code fields allow excessive length inputs without restriction.* *3. Form fields reset and lose entered data when navigating away using the browser Back button.*

Heuristic	*1.Boundary / Goldilocks* *2. Boundary / Goldilocks* *3. Interruption*
Severity	*1.Critical* *2. Major* *3. Minor*

Session debrief

What was covered: Catalog navigation, adding items to cart, cart quantity operations, checkout form input validation (boundary values, dates, card details), and order submission flows. **C**

What was not covered (and why): Password reset and user account management features, as they were outside the scope of the checkout and payment mission.

Issues or blockers during the session: None encountered; the test environment was stable.
